# Journal–Template

This is what my makefile looks like graphically at the minute:

Wednesday 31.10.2018

1. Initialise repository and set up.

2. Start `docs/potential-journals.Rmd` with list and info on possible journals to submit to.

3. Start `docs/literature-review.Rmd` with systematic literature review. This should also be a good source of journals to submit to.

4. Start Web of science searches, download bibliographies into Mendeley, keep track of searches and number of hits in lit-review file. total 179 files atm.

Thursday 1.11.2018

1. Go through the rest of the data bases - except for google scholar.

2. Export 994 articles with abstracts to Mendeley

3. check for duplicates, remove, remove also weird things without abstracts, anonymous weird entries that are clearly not relevant papers etc.
